

BIZ.

The Business Operating Agent for Claude

USER GUIDE

Created by Lommatsch · www.lommatsch.com

What Biz is

Biz gives your business the leadership bench most small companies can't afford to hire. Five roles, one agent:

Role	What it does for you
COO	Watches the whole business: workstreams, blockers, metrics, and the one thing that matters most this week
Consultant & coach	Diagnoses problems before prescribing fixes, pressure-tests your thinking, and follows up on its own advice
Systems & AI advisor	Audits your tools: what overlaps, what's missing, what's overpriced, and where AI would actually save hours
Program coordinator	Tracks who owns what, what's blocked, what's at risk, and what should be cut
Growth advisor	Maps every marketing and sales activity to a number it should move, then tells you keep, kill, or fix

All five share one memory. Whatever any role learns, every role knows.

How Biz remembers

Biz keeps a **dossier** for each company: a folder of plain, readable files on your own computer covering the business model, tool inventory, active workstreams, decisions made (and why), key numbers, and every piece of advice it has given. You can open and read these files anytime; there is no black box.

Every change is saved with history, so you can always see what Biz believed last month and what changed since. If you advise other companies, each one gets its own sealed folder. One client's information never appears in another client's session.

Everyday use: what to say

Running the business

Say...	Get...
"biz" or "how's the business"	Health check: green/yellow/red across sales, delivery, cash, and people, plus the week's priority
"program review" or "what's blocked"	Workstream board: owners, next steps, blockers needing escalation, cut candidates
"monthly review"	Scorecard, what shipped, advice audit, decision follow-ups, patterns
"quarterly planning"	A retrospective first, then at most 3 priorities, each with an owner, a metric, and a stop condition

Getting advice

Say...	Get...
"advise — should I hire a salesperson?"	A real consulting session: diagnosis, evidence, one clear recommendation with its confidence stated
"pressure-test this idea"	The strongest case against your plan, and what evidence would settle it
"stack audit" or "where should AI fit"	Tool-by-tool review with AI opportunities ranked by hours saved per week
"growth review" or "is marketing working"	Every activity mapped to the number it should move; keep, kill, or fix verdicts
"what if we lose our top client"	A three-scenario spreadsheet model with every assumption visible and editable

Client work (for consultants and advisors)

Say...	Get...
"onboard [client name]"	A new client dossier, built from their documents or a 15-minute interview
"switch to [client name]"	Context switch with a 5-line refresher on where things stand
"prep me for the [client] call"	30-second brief: last commitments, open items, and anything overdue on your side
"build the stack audit report" / "make the QBR deck"	A polished, client-ready document or slide deck built from the dossier

Recording things

Say...	Get...
"log — we decided to switch payment processors"	Decision recorded with reasoning and a date to revisit whether it worked
"update — the website launch shipped"	Workstream updated; Biz surfaces what that unblocks

The operating rhythm

Consistency is most of what a good COO provides. Biz runs four automatic check-ins (you approve them at setup):

When	What happens
Every weekday	A silent watchdog scan. You'll see "watchdog: clear" and nothing more, unless a number you care about crosses a line you set, a blocker sits too long, or advice goes stale. Silence is the default; every alert is meant to be worth your attention.
Monday morning	Weekly ops brief: your business health check, ready when you sit down.
First of the month	Monthly review, including an honest audit of Biz's own past advice.
Two weeks before quarter end	Quarterly planning prompt, so next quarter is planned before it starts.

The advice log: why Biz follows up

This is what separates Biz from asking a chatbot business questions. Every recommendation is logged with an owner, a check date, an expected result, and Biz's honest confidence that it will work. Then:

- If the advice sits untouched past its check date, Biz raises it. If it keeps sitting, Biz escalates, and eventually asks you directly: is this still a priority, or should we drop it? Either answer is fine; limbo is not.
- If you reject advice, that's recorded too, with your reason. Biz won't nag you about it again unless something changes.
- When advice is acted on, Biz compares what happened against what it predicted, and says plainly when it was wrong.
- Every quarter, Biz grades itself: where its advice has been reliable, and where you should discount it. You get an advisor that knows its own track record.

Best practices

- **Let it read your meetings.** Connecting Granola is the single biggest upgrade: decisions, commitments, and blockers get captured from your meetings without you typing anything.
- **Keep 3 to 5 numbers current.** Revenue, pipeline, cash. Update them weekly (30 seconds) or connect QuickBooks/HubSpot and forget about it.
- **Set alert lines you actually believe.** The watchdog only alerts on thresholds you choose. Pick numbers where you'd genuinely want to be interrupted.
- **Log decisions in the moment.** "log — we decided X because Y" takes ten seconds and builds something almost no small business has: a record of what you decided, why, and whether it worked.
- **Correct it out loud.** If Biz has something wrong, say so. Corrections stick.
- **Let it push back.** Biz is built to disagree with you when the evidence disagrees with you. That friction is the value; an advisor who always agrees is a mirror.
- **Start thin.** Don't try to feed it everything on day one. A rough dossier that exists beats a perfect one that stalled your setup. It fills in as you use it.
- **Show up to the monthly review.** Especially the months you're too busy. Those are the months something is slipping.

What Biz needs from you

About five minutes a week: read the Monday brief, answer the occasional follow-up, and update any numbers it can't see on its own. Everything else it gathers itself. The more it can see (calendar, email, meetings, books), the less it needs to ask.

Common questions

Question	Answer
Is my data private?	The dossier lives in files on your computer, in a folder you chose. Client folders are sealed from each other. Cross-client lessons are kept only in anonymized form (stage, situation, outcome; never names or identifying details).
Do I need all the connectors?	No. Biz works with whatever is connected and tells you plainly which views are blind rather than guessing.
Can I read or edit its files?	Yes. They're plain text, organized and readable. Edit away; Biz picks up your changes.
What if I disappear for three weeks?	Biz catches up: it reads what happened in your calendar, email, and meetings, and re-syncs the picture. The history is all preserved.
Will it just tell me what I want to hear?	It's built not to. It states confidence, logs its misses, and keeps score on itself, which is exactly what makes the advice worth taking.
